Section 1: Purpose and Scope

The Institute for Safety and Health Management (ISHM) is the premier credentialing organization that monitors and upholds the prescribed standards for the safety and health management industry. The ISHM recognizes Safety and Health Management Practitioners (CSMP) who have taken a less formal path in EHS education but deserve a path to certification.

The CSMP must demonstrate knowledge of health and safety management skills and techniques through experience, training and examination. Experience and training are reviewed in the application process. The CSMP Examination is the final means of determining that a safety practitioner is qualified to undertake the role of a practitioner in safety and health management.

This CSMP Examination Guide provides detailed information about the examination leading to the CSMP credential.

This publication is intended to:
• provide an overview of the ISHM and its certification process as related to the CSMP
• describe the examination, psychometric and scoring process
• outline the body of knowledge
• review exam preparation methods
• describe exam registration process
• provide an overview of what to expect the day of the exam
• recommend study references and resources
• include a practice examination
• alleviate the reluctance of taking exams by providing an understanding of the examination

It is not intended to serve as the sole basis of preparing to take the CSMP examination.

The CSMP Process

Complete and submit application materials and fees electronically through the ISHM website. ISHM will review the application materials to determine if you have met the academic and experience requirements and are eligible to sit for the CSMP examination. If you are eligible, you will be able to take the CSMP exam up to four times in a two-year period immediately following acceptance of the application.

When you are ready to take the examination contact ISHM (info@ishm.org) for arrangements and invoice for the fee for the CSMP examination.

Taking the Exam

The ISHM examination delivery service provider has hundreds of testing centers in the United States and Canada that are open every business day and some are also open weekends and holidays. You will receive your unofficial result as soon as you submit the exam. In most cases, the ISHM will send the official results within a week. (Added 12-18)

If you do not pass the examination, you may register and pay for another CSMP examination as soon as you receive your official results. However, you should try to enhance your knowledge of the subject matter before retaking the examination to increase the likelihood of passing.
CSMP Credential
Once you pass the examination, you will be assigned a certification number and will be eligible to use the CSMP credential. You will receive proof of certification in the form of:

- a wall certificate
- a wallet card

The CSMP credential is renewed annually. You must pay an annual fee in order to retain the use of this credential. You will receive a notice to submit renewal fees in advance. Always update any email and postal address changes to ensure that notices reach you. You will also begin to receive a monthly newsletter and be encouraged to join ISHM via LinkedIn for stimulating practitioner discussions.

Recertification
Every five (5) years you will be reminded to submit the Continuance of Certification (COC) worksheet as proof of having achieved 20 COC points. To maintain certification, a CSMP must provide written evidence of continued qualifications by submitting a COC worksheet or successfully completing the CSMP examination in the fifth year of the cycle.

Section 2: Overview of the CSMP Certification

In 2013, the Institute for Safety and Health Management (ISHM) recognized the need for a safety and health management designation for those who do not have sufficient formal education in environmental health and safety. The CSMP designation was created to recognize those performing occupational safety and health activities, either as part of their duties or full time, such as would be performed by an active safety team participant, line manager, human resources professional or a wage associate.

The CSMP designation is intended for those who work under the direction of a safety manager and may be involved in business and financial responsibilities. They must understand hazard analyses, incident investigations, safety audits and surveys, workers’ compensation, product safety, environmental laws, quality, and labor relations. Holders of this designation have passed a rigorous examination that measures their knowledge in four distinct areas:

- General and Business Management
- Management Methods and Systems
- Safety, Health, and Environment Applications and
- Risk Identification, Management and Control.

Accreditation

The CSHM designation is accredited by the Council of Engineering and Scientific Specialty Boards (CESB), a leader in setting quality standards for credentialing organizations. The CESB is a self-sustaining, independent body that accredits certification programs organized and operated consistent with sound credentialing practices, tailored to the needs of engineering and technology specialties and The International Certification Accreditation Council (ICAC). The ICAC operates under the international guidelines established as a quality assurance regime for accreditation bodies (ISO/IEC 17011 – Conformity Assessment: General Requirements for Accreditation Bodies Accrediting Conformity Assessment Bodies) and has established assessment tools and processes that assure certification bodies are in compliance with ISO/IEC 17024 (2012): Conformity Assessment – General Requirements for Bodies Operating Certification of Persons.

By accrediting certification programs, the public and the industries represented have an additional level of
assurance, knowing that the program has been reviewed by a neutral third party and been found to meet or exceed reasonable levels of record keeping, security, objectivity, and professionalism.

The ISHM is the credentialing organization that administers the Certified Safety Management Practitioner (CSMP) designation according to the standards set by the CESB and ICAC.

Benefits
The value of the CSMP certification is without a doubt beneficial to one’s professional career. The Certified Safety Management Practitioner enables employers to achieve an ingrained safety culture that shows safety starts at the top and is an integral part of the responsibilities of every function of line and staff management.

The CSMP certification reflects one’s commitment to the profession. Among the benefits of achieving the CSMP certification are:

• Preparing for the examination, the CSMP has sharpened their knowledge base
• Recognition from peers as not only a qualified safety practitioner but management material
• Recognition by Human Resources as having been qualified for the managerial position in the safety field.
• ISHM provides representation for promoting and protecting the CSMP certification.

Advantages to an employer to hire a CSMP:

• Crucial attention is focused on the management of safety programs
• The CSMP will remain current in the field by way of the 5-year Continuance of Certification (COC) process
• The employer can be confident that knowledge and skills in safety and health management have been validated.

Qualifications
Candidate training and experience must be validated through the application process before taking the examination. Candidates who possess a valid designation of similar experience and training may be deemed to meet the criteria, and may not be required to submit transcripts, but rather provide proof of certification. Individuals who meet the criteria outlined in the table may be eligible to sit for the CSMP examination.

NOTE:
• Full time professional safety and health management experience acceptable to the Institute requires position duties with 50% or greater safety and health management related activities.
• Two years of part time experience (25% or greater safety and health management related activities) may be substituted for one full time year

Graduate from a board approved / ABET Certified degree program

ISHM – CSMP Exam Guide 500.03 R1
Rev. 12/2018
Doctorate/Master's in Safety Related Field | Eligible to sit for CSMP Exam  
Bachelor's in Safety Related Field | Eligible to sit for CSMP Exam  
Associate in Safety Related Field | 1 Year  

-OR-

College or University Graduate in *Any Field*  
Degree Accredited by a Member Organization of the Council on Higher Education Accreditation | Qualifying Experience Requirement  
Doctorate/Master's Degree in Any Field | Eligible to sit for CSMP Exam  
Bachelor's Degree in Any Field | 1 Years  
Associate Degree in Any Field | 3 Years  

-OR-

High School Education  
Diploma or GED | Qualifying Experience Requirement  
High School Diploma or GED | 3 Years  

-OR-

**Holder of a Certification, Designation or Certificate**  
Designation or Certificate | Qualifying Experience Requirement  
Safety Certificate Recognized by the ISHM Board | Eligible to sit for CSMP Exam  
Holder of ASHM, ASP | Eligible to sit for CSMP Exam  
CHST, OHST, or CLCS Designation from the Council on Certification of Health, Environmental, and Safety Technologists (CCEHST) | 2 years  
CAIH Designation from the American Board of Industrial Hygiene (ABIH) CSS Designation from the National Safety Management Society | 2 years  
Safety Certificate Recognized by the ISHM Board | 2 years  

**Application Process**  
1. Complete application form [https://www.ishm.org/content/ishm-certification-application-form](https://www.ishm.org/content/ishm-certification-application-form)  
2. Attach a copy of a current government issued picture identification card as a PDF  
3. Attach a copy of high school degree, GED or college transcripts or certification title and number  
4. Submit three (3) professional references; use ISHM Reference Forms, [https://www.ishm.org/content/ishm-certification-reference-form](https://www.ishm.org/content/ishm-certification-reference-form)  

**Applications that are not fully completed will not be considered.** When ISHM receives the application, you will be invoiced the application fee ($125.00 United States, $150.00 USD International). Application fees are nonrefundable.

**Section 3: Overview of the Examination**  
Eighty percent (80%) of the questions for the CSMP examination are derived from the National Safety Council’s (NSC) Supervisors’ Safety Manual, Tenth Edition. The remaining 20% of the questions were developed by volunteer CSHMs following the ISHM Manual for Writing Test Questions. (CSHMs receive 1 COC point for 5 acceptable test questions.) Questions are reviewed, edited and evaluated before they are entered in an exam. A final review of the exam is conducted by the ISHM Exam Committee before being certified for use.
The arduous process of question development and validation ensures that items are:

- clear, unambiguous and grammatically proper
- technically correct
- appropriate in terms of fairness, geographically, ethnically and culturally
- correctly coded to the CSMP exam blueprint

**Description of the exam**

The two-hour examination consists of 100 multiple-choice questions, allowing approximately 1.2 minutes per question. It is made up of single questions that stand alone and do not depend on multiple-question, scenario-related, background information.

The questions consist of three parts:

1. **Stem** - states the problem or question to be answered; may be a simple question or statement to be completed, or it may be complex and contain background information leading up to the question or statement.
2. **Correct Answer** - one of four potential options which represents the only correct response or the best correct response. (“Best” means a panel of experts would agree to this judgment.)
3. **Distracters** - three distracters serve as incorrect responses. They are plausible, yet wrong, or not the best possible option.

**Example:**
Stem: Typically, the most unreliable tool utilized in the selection process is:
Correct Answer: *A. employment interview.*
Distracter: B. selection test.
Distracter: C. physical examination.
Distracter: D. background check.

Four option multiple-choice questions are used because they:

- are flexible and adaptable
- tend to be more reliable than other formats
- can accommodate a wide range of skills, knowledge and abilities to be measured
- provide good sampling
- have low chance scores

**Examination Content**

A role delineation survey is conducted every 5 years to define the Body of Knowledge for the examination and for the allocation of questions. Accordingly, chapters of the NSC’s Supervisors’ Safety Manual are selected from which to develop the majority of the questions. The manual presents the information supervisors need for the three aspects of loss control: recognizing hazards, determining levels of acceptable risk and controlling hazards. Approximately 20% of the questions are selected from a pool developed by volunteer CSHMs.

**Psychometric process**

Psychometric services provide expertise in best practices regarding the design and analysis of the exam. The ISHM consults with psychometricians in all stages of the exam development process, including the standard setting process which ensures the passing score will accurately reflect the distinction between candidates ready to assume the role of a safety management practitioner, and those not yet ready. In addition, the ISHM can be confident that the process followed to make this distinction meets the industry standard of psychometric defensibility.
Passing Score
The score is based on the number of questions that are answered correctly. A passing (cut score) grade is determined using the expert judgments of a standard setting panel of at least 10 CSHMs. The panelists first conceptualize the minimally competent, or borderline candidate to make more appropriate and grounded judgments regarding the difficulty of the test questions. It then rates each question with respect to the CSMP candidate who is minimally competent to sit for the exam and should know the correct answer. It reflects the difficulty of the question and the degree to which questions are common for all areas of practice.

The psychometrician reviews the results generated by the panel and calculates the initial passing score using the modified Angoff procedure. As examinations are modified, and question performance is evaluated, the minimum passing score is routinely adjusted accordingly.

Body of Knowledge
The ISHM Board of Directors developed the Body of Knowledge using the NSC’s Supervisors’ Safety Manual as a guide. They considered the duties of an active safety team participant, line manager, human resources professional and wage associate who works under the direction of a safety manager and established the blueprint for the CSMP examination.

The Body of Knowledge contains a description of four major domains and the practice areas that make up those domains as well as skills and knowledge needed for these practice areas. The ISHM Board of Directors ranked them and assigned a percentage for each, in parentheses, according to its importance, to help ensure that ISHM is aligning the certification practices to the needs of the industry.

Body of Knowledge and percentage of questions in each area:

**Domain I - EHS Leadership & Commitment 25% of test**
1: General and Business Management
2: Communication
3: Employee Involvement

**Domain II - EHS Planning & Prevention 26% of test**
1: Risk Identification, Management and Control
2: Safety Management
3: Behavior-Based Safety: A Practical Approach
4: Safety and Health Training
5: Regulatory Issues
6: Machine Guarding)
7: Hand Tools and Portable Power Tools
8: Material Handling and Storage
9: Electrical Safety
10: Fire Safety

**Domain III - Safety, Health & Environmental Operations 25% of test**
1: Industrial Hygiene
2: Personal Protective Equipment
3: Ergonomics
4: Hazard Communication

**Domain IV - Assessment & Evaluation 24% of test**
1: Safety and Health Inspections
2: Incident Investigation
Section 4: PREPARING FOR THE EXAMINATION

Preparation is imperative for examinees. There are several methods available in preparing for the Certified Safety Management Practitioner (CSMP) Examination. Because the CSMP examination is largely based on the National Safety Council’s (NSC) Supervisors’ Safety Manual, Tenth Edition, preparation is best accomplished by knowing the content of the book and being able to apply the concepts within the book.

ISHM serves as a standard setting and credentialing organization. It does not provide professional development programs. Professional organizations, such as the National Safety Management Society (NSMS), American Society of Safety Engineers (ASSE) and National Safety Council (NSC) can serve as a resource in surveying and selecting a preparation method.

Study Methods

Individual Self-Study – One studies at their own pace to suit their schedule. Individual self-study requires a high degree of personal discipline. One must develop a strategy, schedule preparation and remain on track. The NSC’s Supervisors’ Safety Manual, Tenth Edition serves as a starting point for individual self-study.

Paired Self-Study involves the buddy system. Two examinees are matched up and utilize the same format as the individual self-study. This method is highly flexible while at the same time offering the potential examinees the feeling of not “doing it alone.”

Group Study offers some advantages over individual and paired study. The camaraderie and support of the group can be a great asset. Some key concepts to consider in establishing a study group are:

- Convenient meeting locations and times
- A CSMP to serve as mentor
- Pre-tests using the same examination formats as described in Section 3.
- A study format with a schedule and individual member assignments

Preparation Courses

ISHM is not involved in the development, content, or distribution of course materials for the CSMP Examination. It neither endorses nor guarantees that the training provided is accurate or complete.

Some colleges and universities with Public Health or Environmental Health and Safety Programs offer exam prep courses. Other independent trainers or organizations may also provide workshops. The National Safety Council (NSC) provides the course, “Supervisors’ Safety Development Program” (SSPD), which is based on the NSC Supervisors’ Safety Manual. For information and course schedule, refer to http://train.nsc.org/ntc/TCALDet01.aspx?id=59.

Other Resources

Another resource for courses is professional organizations such as American Society of Safety Engineers, National Safety Management Society and National Safety Council. They may also be able to provide contacts within your area when attempting to set up an examination study group.
Section 5: REGISTRATION PROCESS AND WHAT TO EXPECT

In order to maintain the integrity of the exam administration and subsequent investigation, the proctor is responsible for documenting specific occurrences during the examination. ISHM policies and procedures for administering examinations have two related goals: providing candidates comparable opportunities to demonstrate their abilities and preventing anyone from gaining an unfair advantage. To promote these objectives, ISHM reserves the right to investigate when, in the sole discretion of the ISHM, a testing irregularity occurs:

- cheating is suspect,
- there is an apparent discrepancy in identity,
- plagiarism or misconduct is evident,
- aberrancies in performance are detected for which there is no satisfactory explanation, or
- the results are believed to be invalid for any other reason.

Questionable conduct before, during or after testing may be disputed through legal channels including copyright legislation, civil liability and/or criminal litigation.

Exam Registration
When the CSMP application is approved and you are ready to take the exam, contact kaylene@ishm.org to inform ISHM you are ready to take the exam. You will receive an invoice for the exam fee ($200 first exam, $100 exam retake) and be directed to schedule a time, date and location for the exam. The exam must be taken within two years of application acceptance. If circumstances arise, a candidate may request to purchase an extension, 12 months $100.00, 6 months $50.00 or 3 months $25.00.

Testing Sites
United States – To locate a convenient testing center in the United States, go to the COMIRA website Candidate Center page, http://candidate.comiratesting.com/comira/, select the Institute for Safety and Health Management link, click on the Safety and Health Manager Certification link and enter your zip code. Inform ISHM (info@ishm.org) of your selection and that you are ready to sit for the examination.

International – Arrangements can be made at a centrally convenient testing site when candidates are prepared to take the examination. Contact ISHM (info@ishm.org) to review options. Exams administered outside of the United States will be in US English.

Examination Day
Bring to the Exam testing site:
- Exam username and password
- Government issued valid photo identification
- Emergency contact information

Permissible Items:
- Closed book
- Scrap paper and pencils; scrap paper to be collected by the proctor and destroyed after the exam

Prohibited: Cell phones, pagers and calculators must be turned off and stored in a secure location before entering the examination room. You may not access personal belongings until you complete the exam.
Exam Instructions

- Upon entering the test site show the proctor your government issued photo identification, present emergency contact information and sign the roster sheet.
- You will be accessing an unsecure browser; do not navigate away from it.
- The exam website is ishm.proexams.com. When the proctor unlocks the system, enter the username and password you received with the exam scheduling confirmation.
- 2 hours are allotted to complete the 100 multiple choice question exam; the exam interface has a countdown timer to help you judge your time.
- The 2-hour time limit does not start until you begin the exam.
- Do not skip the short 5 question sample test which gives you a feel for how it works. This does not count against your exam time.
- There is a calculator and a section where you can park questions you are not sure of.
- You can view a log of unanswered and answered questions at any time.
- If you experience a technical difficulty, notify the proctor immediately and close the browser as doing so pauses the exam automatically and no time is lost.
- Before reporting technical issues to tech support, close the browser, reboot the computer and log back in to resume the exam. If the issue persists, ask the proctor to contact technical support.
- When you have completed your exam and hit the submit button, the screen will display pass or fail and your unofficial score.
- The exam will cease automatically at the 2-hour mark. If you do not complete the exam before it times out, all progress and submitted work will be saved.
- When finished, you will be asked to sign out of the test center and leave the room until everyone has completed their exam.

Test Taking Suggestions

- Trust your first impressions. There is a correct answer to each question and it is believed that your first impression of the correct answer will be a better choice.
- Avoid over analyzing. Do not read too much into an answer.
- If you are stumped by a question, continue to the next question so you don’t lose valuable time and rush through the questions at the end.
- Don’t look for answer patterns. The psychometric testing process ensures that questions do not fall into patterns.
- Length of an answer is a false clue.
- Eliminate obvious distracters. When you first read the question, you should be able to eliminate two of the answers as incorrect. If you cannot decide between the other two, cross out the two you determined to be distracters, move on to the next question and return to the unanswered question later.
- Identify what you believe the answer will be before reading the choices.
- Use “educated guesses.” If you still cannot decide on a correct answer after eliminating one or two distracters, choose one anyway.
- There is no penalty for guessing on the exam. You will be penalized for NOT choosing an answer.
- Review your answers when you complete the exam.
- Don’t rush. You will not receive more points for finishing first.

Appeals

An applicant who has been barred from finishing the exam shall have the right to a personal appeal. Direct the appeal to the ISHM office. He will investigate within 5 days of receipt of the appeal. The appeal shall be limited to the examination process and the issues related to terminating the exam prior to completion. To the ISHM office shall forward the results of his findings to the ISHM Executive Committee who will have 10 days to review the appeal. The decision of the Executive Committee shall be final, and the decision of the Committee shall be forwarded to the person filing the appeal within 5 days of their decision.
Section 6: Repeating Examination

Rules and Fees
When a CSMP candidate fails the examination, they may re-take the exam for the reduced fee of $100.

Examination for Continuation of Certification (COC) Points
Twenty (20) COC points can be earned by re-taking and passing the CSMP examination in the fifth year of the COC Cycle. If a CSMP was grandfathered in and did not take the exam, 20 points can be earned for taking the exam subsequently.

Course Instructor Exceptions
A professional trainer who is interested in preparing either an online course or a classroom session for the ISHM exams, may be permitted to sit for the exam without applying for certification. The ISHM Board of Directors will vote on each request individually.

A CSHM who is interested in preparing course materials may take the CSMP examination to become familiar with the examination.

Any course instructor approved to take the exam may take the examination without limit, provided they pay the fee every time. As with any applicant, the cost of the first exam is $200. Subsequent exams will cost $100.

APPENDIX

A. Safety Management References
These reference materials are recommended because they provide information relative to safety and health management topics. Although exam questions may cover similar subject matter they are not necessarily drawn from the specific material in these references. The exam may also feature a few questions about subjects not covered in traditional safety and health management references such as finance or labor relations as examples.

1. Industrial Hygiene–Fundamentals of Industrial Hygiene, Barbara A. Plog, Patricia J. Quinlan, NSC Publication.
2. Ergonomics-Fitting the Task to the Human, Kroemer, k.H.E.: and Grandjean, E.
5. Training-The Trainer’s Handbook, Lawson

B. Sample Questions
The Certified Safety Management Practitioner Examination Practice Items are intended to familiarize prospective examinees with the style and format of the CSMP examination questions. There are 36 objective practice items, whereas the actual CSMP examination contains 150 objective items. These practice items will not be found on the actual CSMP certification examination. They are only a representation of the type of items found on the certification examination. A quick scoring key and the rationales for the answers are at the end.

Remember to select the BEST answer

I. GENERAL AND BUSINESS MANAGEMENT

1. A hazard analysis can be used to evaluate a potential hazard; what other information should be considered?
   a. Injury reports
   b. Statistical data
   c. Risk assessment
   d. Fatality investigations

2. Which leadership style will have the most positive effect on subordinate satisfaction for employees who work on stressful, frustrating or dissatisfying tasks?
   a. Supportive
   b. Achievement-Oriented
   c. Participative
   d. Contingency

3. Which leadership style will help employees to strive for higher standards of performance and have more confidence in their ability to meet challenging needs?
   a. Directed
   b. Achievement-Oriented
   c. Participative
   d. Performance

4. Which of the following is TRUE concerning goals?
a. All the following are true
b. Employees who are assigned value goals perform better than those employees who are given
   specific goals
c. Employees given moderately difficult or easily attainable goals perform better than those given
   high challenging goals
d. Pay and feedback lead to improved performance only when they lead individual employees to
   set high goals

5. Which of the following are recognized strategies for multi-national companies to use in dealing with the
   diversity of statutory laws governing it?
   a. All the following
   b. Lobby to change the laws in each country so they are all the same
   c. Make all operations conform to the strictest country law
   d. Make operations in each country responsible for compliance with that country’s laws

6. Common law differs from statutory law. Which of the following statements is TRUE?
   a. Statutory law passed by a legislature
   b. Statutory law is defined over a period of years by judges
   c. Common law refers to a law that is often violated
   d. Common law is a statute that amends a state constitution

7. What functional area is typically responsible for functions related to design, construction, standards,
   and repair?
   a. Engineering
   b. Facilities
   c. Logistics
   d. Research and Design

8. Who are the customers of the occupational safety function?
   a. All employees in an organization
   b. All employees in an organization and the community as a whole
   c. The safety manager, supervisor, peers, and subordinates
   d. From the CEO-level of management to the line worker

9. Some ways the safety management practitioner can determine training needs is to:
   a. All the following
   b. surveys
   c. Review regularly scheduled inspections for needs
   d. Conduct an employee opinion survey

II. EHS MANAGEMENT METHODS AND SYSTEMS
10. The terms incidents and injuries are often used interchangeably. Actually, the meanings are:
    a. Synonymous
    b. Different
    c. Diametrically opposed
    d. Identical

11. A tool that enables a team to identify, explore and graphically display the possible causes of an incident
    or hazardous condition is:
    a. A fishbone diagram
    b. An affinity diagram
    c. A matrix diagram
    d. An interrelationship diagram
12. The system safety method, MORT, stands for:
   a. More Observation and Repetitive Training
   b. Management Oversight and Risk Tree
   c. Management Obstacles and Responsive Techniques
   d. Management Objectives and Regulatory Training

13. One method often used in system safety programs for complex systems is:
   a. Fault tree analysis
   b. Fishbone analysis
   c. Pareto chart analysis
   d. Audit analysis

14. Calculate the incidences rate for a company if the recordable incidents are 40 and the total hours worked are 1,500,000:
   a. 2.6
   b. 5.3
   c. 8.7
   d. 10.2

15. Which of the following techniques would be most likely to increase the motivation and satisfaction of people at work?
   a. Job placement
   b. Responsibility of workers
   c. Satisfaction of workers
   d. Job enrichment

16. What are the two main causes of incidents in the workplace?
   a. Unsafe acts and unsafe people
   b. Unsafe people and unsafe machines
   c. Unsafe conditions and unsafe machines
   d. Unsafe acts and unsafe conditions

17. According to William C. Pope, the three causal factors of an incident are:
   a. Training, oversight, inadequate system
   b. Defect, management, training
   c. Error, defect, oversight
   d. Regulation, error, attitude

18. There are several factors that are often used to determine when an organization should have the services of a full time Safety Practitioner. Which of the following is generally acknowledged to be the prime-determining factor in assigning safety personnel?
   a. The incident rate of organization
   b. The seriousness of incidents suffered by the organization
   c. The potential for serious injuries in the organization
   d. The type of industry the organization is involved in

19. According to Pope, prior to 1960, safety and incident prevention used what type of approach to reduce injuries?
   a. Situational Leadership Approach
   b. Engineering Approach
   c. Classical Management Approach
   d. Contingency
20. The main goal of Worker’s Compensation law is to:
   a. All the following
   b. To give the employee the opportunity to plead his case and speed up the waiting period for just compensation
   c. To eliminate negligence and product liability claims
   d. Compensate workers for injuries caused by incidents arising out of and in the course of employment

21. Housekeeping requirements for safe construction sites include all of the following EXCEPT:
   a. Keeping site reasonably dry and clear of debris, scrap and protruding nails
   b. Providing containers for the collection and separation of waste, trash, oily rags and any other refuse.
   c. Removing combustible scrap at regular intervals
   d. Storing all flammable wastes in a barrel or similar container with open top for convenient deposit and frequent removal.

III. SAFETY, HEALTH, AND ENVIRONMENT APPLICATIONS

22. Which of the following is a term used to describe the condition “epicondylitis”?
   a. Trigger finger
   b. Rotator cuff
   c. Roofer’s wrist
   d. Carpenter’s elbow

23. The most common of the work-related musculoskeletal disorders, and in economic terms, the costliest is:
   a. Carpal Tunnel Syndrome
   b. Tendonitis
   c. Epicondylitis
   d. Low Back Pain

24. The delay between exposure and observable effects is ______________.
   a. Down time
   b. Latency period
   c. Effect delay
   d. Synergism

25. Which analysis method is the most effective at determining potential problems in a given system?
   a. Preliminary Hazard Analysis
   b. Job Safety Analysis
   c. Fault Tree Analysis
   d. Failure Mode Effect Analysis

26. Dilution ventilation is used to:
   a. Control a contaminant at its source
   b. Control fumes from lead fusing
   c. Control low toxicity vapors
   d. Control asbestos

27. As one ages there is a vascular and neural degeneration of the inner ear that results in a decrease in hearing ability. This condition is called:
   a. Sensoneural
   b. Sociocusis
   c. Presbycusis
28. Which of the methods listed below is not allowed in supplying air for SCBA, airline respirators, or combination units?
   a. Filtered breathing air grade “D” or higher
   b. Manifold cylinders of high-pressure air
   c. Oil pumped compressed air with filtering
   d. Hospital grade oxygen

29. Which is the most effective method of reducing contamination to workers?
   a. PPE
   b. Administration controls
   c. Fans
   d. Engineering controls

IV. RISK IDENTIFICATION, MANAGEMENT AND CONTROL

30. What percentage of all injuries to people happens on the job?
   a. 1/5 –20%
   b. 1/4 –25%
   c. 1/2 –50%
   d. 3/4 –75%

31. On the job injuries and illness cost money, time, and effort. What is the most practical way to manage these losses?
   a. Make sure safety is part of labor contracts
   b. Aggressive claims handling
   c. Effective safety and loss control programs
   d. Good insurance coverage

32. In regard to a safe driving program, management is responsible for which of the following:
   a. All of the following
   b. Developing written standards for driving of company vehicle
   c. Conducting regular driver training and requiring immediate reporting and investigation of every incident
   d. Having corporate performance goals and keeping driver records

33. The lighting system failed, causing a short, which resulted in a fire. What class of fires would this be?
   a. Class A
   b. Class B
   c. Class C
   d. Class D

34. Mesothelioma is associated with
   a. Welders
   b. Asbestos Workers
   c. Beryllium Workers
   d. Excessive Vibration

35. The process of pooling security ideas and viewpoints of architects, security and safety practitioners and local police and fire officials in a coordinated effort to produce a facility with planned defenses before the actual construction is known as what?
   a. SMBO
   b. Crime prevention through environmental design (CPTED)
c. Safe Construction
d. Planned Protection

36. Emergencies can arise in an organization at any time and from many different causes. The best safety management tool for minimizing disaster is to:
   a. Screen candidates and hire only safe workers
   b. Have a written comprehensive management plan
   c. Keep in good contact and relations with the local fire department
   d. Purchase only safe equipment and materials

ANSWERS AND RATIONALES FOR PRACTICE QUESTIONS

1. Answer: c. Risk Assessment The hazard analysis identifies the potential hazards that exist, the risk assessment also may identify potential hazards, but it will also put a value on the risk associated with the potential hazards.

2. Answer: a. Supportive supportive leadership role would be the most effective type of leadership because it enables the employees to discuss the problems with management. It allows for feedback and open lines of communication.

3. Answer: b. Achievement-oriented Achievement-oriented leadership encourages a high level of performance with challenging goals emphasizing excellence and demonstrating confidence in employee ability.

4. Answer: d. Pay and Feedback lead to improved performance only when they lead individual employees to set high goals. Performance related pay (feedback) offers a means of rewarding outstanding performance, maintaining accountability, providing incentives for effort and productivity, and attracting and retaining good staff in a competitive market.

5. Answer: d. Make operations in each country responsible for compliance with that country’s laws. Failure to comply with a jurisdictions law could lead to criminal violations, civil violations and unnecessary lawsuits. However, the uniqueness of country requirements makes using the “strictest” law for all countries impractical. Although compliance with local laws is a minimum, many multinational companies also have safety policies with stricter standards than some countries may require.

6. Answer: a. Statutory law is passed by a legislature The distinctive feature of common law is that it represents the law of the courts as expressed in judicial decisions. The grounds for deciding cases are found in precedents provided by past decisions, as contrasted to the civil law system, which is based on statutes and prescribed texts.

7. Answer: b. Facilities Facilities are concerned with the general layout and overall operation of particular buildings or structures. Engineering, logistics, and research and design are usually applied to a specific concern or problem.

8. Answer: b. All employees in an organization and the community as a whole When discussing the role of the occupational safety function every person involved with a particular organization must be considered. This includes all employees, their families, the organization’s customers and the community as a whole; only focusing on the work can miss important opportunities to protect employees and promote a safety culture.

9. Answer: a. all of the following
10. Answer: b. Different
An incident is defined as an event that has the potential to cause physical harm. An injury is a form of hurt, damage, or loss usually to a person resulting from an event. Some incidents do not involve an injury.

11. Answer: a. A fishbone diagram
The fishbone diagram is an analysis tool that provides a systematic way of looking at effects and causes that create or contribute to those effects. The value of the fishbone diagram is to assist teams in categorizing the many potential causes of problems or issues in an orderly way in order to identify root causes.

12. Answer: b. Management oversight and Risk Tree

13. Answer: a. Fault Tree Analysis
Fault tree analysis can identify possible system reliability or safety problems at design time. It also allows the user to backtrack a single incident to its entire potential root causes. These causes may be unrelated and may be missed in other systems. As well, fault tree analysis allows the user to “see” the entire system that is being examined.

14. Answer: b. 5.3
The incident rate is the number of recordable injuries as delineated by the U.S. Occupational Safety and Health Administration (OSHA) per hundred employees. The incident rate is calculated by multiplying the number of recordable injuries by 200,000 hours worked (OSHA constant), then dividing by the number of actual hours worked.

\[
\text{I.R.} = \frac{\text{# of incidents} \times \text{OSHA constant for hours worked}}{\text{# of actual hours worked}}
\]

\[
= \frac{40 \times 200,000}{1,500,000} = 5.3
\]

15. Answer: d. Job enrichment
Fredrick Herzberg coined Job enrichment; it describes making the work environment less dissatisfying to the worker. Grievances, decreases productivity, and even strikes are examples of how a dissatisfying work environment can hurt an organization. One can enrich the job by allowing the opportunity for a worker to gain a sense of achievement, responsibility, advancement, and growth.

16. Answer: d. Unsafe acts and unsafe conditions
Unsafe acts and unsafe conditions are the broad definitions of the main causes of accidents. Unsafe acts include: unsafe methods, using damaged equipment, or failing to use PPE. Unsafe conditions include: not using guards on machines or equipment, defective design or construction, or inadequate use of PPE. There may also be many underlying factors and root causes that contribute to unsafe acts and conditions. They may include: lack of skill, improper training or failure of operational procedures.

17. Answer: c. Error, defect, and oversight
Incidents rarely happen from a single cause. Incidents are multi-factorial and arise through a clearly defined sequence of events, which involve performance errors, changes, oversights and omissions. Errors, defects, and oversights relate directly to the production process. They manifest themselves as losses in the form of poor quality, excessive waste, etc.

18. Answer: c. The potential for serious injuries in the organization
Staffing is driven by potentially serious injuries, not by actual adverse history. If a hazardous operation such as a chemical plant or refinery has a good safety record, they do not eliminate staff because there are no injuries. It is the potential hazard level and also the regulatory compliance demands that come with the high potential hazards that drive the staffing.

19. Answer: b. Engineering Approach
An engineering approach was consistently used as a way to reduce incidents. It was the engineer’s job to design equipment that was safe to operate, regardless of whether the equipment was used correctly.

20. Answer: d. Compensate workers for injuries caused by incidents arising out of and in the course of employment
Before the Worker's Compensation law, workers who were injured on the job were not compensated in any manner. The worker could sue the company, but the view of the courts was the worker assumed all risks associated with the job and was responsible for all injuries arising out of and in the course of employment.

21. Answer: d. Storing all flammable wastes in a barrel or similar container with open top for convenient deposit and frequent removal. According to 29 CFR 1926.25(c), containers used for garbage and other oily, flammable, or hazardous wastes, such as caustics, acids, harmful dusts, etc. shall be equipped with covers.

22. Answer: d. Carpenter’s elbow
Epicondylitis, also called tennis elbow, is a chronic condition of inflammation affecting the outside of the elbow where the tendons are attached. Repeated gripping or twisting can cause inflammation at the site where the tendons attach. Trigger finger is a condition affecting the finger, usually associated with these triggering a vibrating power tool with some force. The rotator cuff is the group of tendons around the shoulder process. Roofer’s wrist is associated with the wrists and usually develops from long-term deviation from neutral wrist position.

23. Answer: d. Low Back Pain
Liberty Mutual Insurance Company reported their worker’s compensation claim expenses as being roughly 33% musculoskeletal disorders (MSDs) in the OSHA ergonomics documents. MSD claims are often more expensive than other claims. By far the largest amount of money and lost time for MSDs is from low back pain because of their higher prevalence relative to other MSDs. Low back pain MSDs make up 15% of all Liberty Mutual’s worker compensation claims and 23% of their compensation costs.

24 Answer: b. Latency Period
This delay can be observed in serious occupational diseases such as asbestosis and silicosis, which can have effects not realized until years and even decades after exposure.

25 Answer: d. Failure Mode Effect Analysis (FMEA) FMEA is an easy to use and yet powerful pro-active engineering quality method that helps you to identify and counter weak points in the early conception phase of products and processes. The structured approach makes it easy to use and even for non-specialist a valuable tool. The benefits obtained encompass by large the investments in time and resources to execute the analysis.

Dilution ventilation relies on bringing fresh air into a room and mixing it with contaminated air to lower the concentration of the contaminant. There are several factors that can affect the effectiveness of dilution ventilation such as mixing efficiency, cross drafts, worker positions, and proper air flows at the source and the exhaust. To control toxic materials such as lead or asbestos, a capturing hood or enclosing hood should be used, as they are more effective at capturing contaminant at its source. With dilution ventilation, there is a good possibility that contaminant may spread throughout the room, and this is undesirable if the material being handled is toxic or hazardous.

27. Answer: c. Presbycusis
Presbycusis is mostly due to aging, as it usually gradually decreases a person’s ability to hear high-level pitched sounds. This gradual change may be due to prolonged exposure to high sound levels over many years. A person who suffers from presbycusis may experience such symptoms as having difficulty understanding someone talking to them, especially when there is background noise.

28. Answer: d. Hospital Grade Oxygen
Hospital grade oxygen is not allowed to be used for supplying air to a SCBA. Filtered breathing air grade “D” or better, high pressure manifold cylinders, and oil pumped compressed air are all acceptable means of providing air to a SCBA as long as the precautions mentioned in OSHA’s respiratory standard are met.

29. Answer: d. Engineering Controls
Engineering controls are the most proactive and effective methods of reducing exposure. They reduce risk by controlling or eliminating contamination at their source. Administration controls and PPE are secondary protection measures and can be helpful if engineering controls cannot be applied.

30. Answer: c. ½ -50% 12
Statistics show that the most common work injuries are orthopedic injuries, principally back and hand injuries. Other common types of work injuries are: Industrially caused cancers, Respiratory problems such as asthma, Hearing loss due to acoustic trauma/noise exposure on the job, Depression and other psychiatric conditions which arise as a consequence and outgrowth of physical injuries on the job, Heart conditions including heart attacks and coronary artery blockage, heart attacks triggered by physical stress on the job.

31. Answer: c. Effective safety and loss control programs
On the job injuries and illnesses cost money, both in direct costs such as workers’ compensation payments, and indirect costs such as investigation time, replacement training, product damage, and lower morale. It is better to prevent losses through a safety program than to try to reduce the expenses after the injury has happened.

32. Answer: a. all of the following

33. Answer: c. Class C
Class A –used for paper combustibles
Class B –used for combustible liquids from gasoline etc.
Class C –fire extinguisher used to extinguish electrical fires
Class D –used to extinguish combustibles metals

34. Answer: b. Asbestos workers.

35. Answer: b. Crime prevention through environmental design (CPTED)
Crime prevention through environmental design considers everyone’s viewpoints into the security of the building. It is done during the planning stage of the building and grounds. This helps security because it has features built in by the architects with safety practitioners and local polices ideas still fresh in their head when designing. Instead of trying to put safety first after the building is already built with design flaws that employees must try to work around.

36. Answer: b. Have a written comprehensive management plan
All of the other answers are good ideas but no matter how safe you think you are, an incident can happen. Therefore, the only way to be prepared is to have a written comprehensive management plan
